

File name: UW x Real Chemistry - Data Options.xlsx

Data description: Real Reddit conversations about kidney disease (nephrology), including conversations within different reddit communities

Time period covered: July 2023 - 2024

Data collection methodology: Data was collected using Quid: An AI-powered data collection model within the time frame.

Number of observations: 102 short excerpts from Reddit posts or comments

Relevance: This data could answer the important question: What are the frustrations that people withhold from sharing with their doctors? What are the things left unsaid when dealing with these struggles? The reddit community itself gives people a community where they feel comfortable enough to share these frustrations and to find connections. We can also see the general tone concerning different issues and also find out about personal experiences of the target audience.

Variables:

The following list contains descriptions for each of the columns in the dataset:

Sound Bite Text: Short excerpt of text from a Reddit post or comment (character)

["Turns out when I came back home and got an appointment at a nephrologist, my lab results confirmed there is no evidence that I ever had this disease as everything regarding my kidney function was optimal."]

{Some entries are almost duplicates of others; most of the same text with added links or a few changed sentences/words. No missing values}

Title: The title of the Reddit post created by the original user (OP) (character)

[Possible IgAN]

{Some title names have typos in them, as they were copied into this data set directly. No missing values}

Source Name: Name of the Reddit community/subreddit where the sound bite text came from (character)

[r/IgANephropathy (most common), r/kidneydisease]

{There are a few outliers within the Source Name data, with "r/IgANephropathy" being the most common subreddit people post under. A few outliers, though, include:

"r/Gymnastics", "r/moreplatesmoredates", "r/herbalism", as well as "r/Militaryfaq". These only appear once or twice in the dataset, and we have taken note of that. No missing values}

Post: Category that specifies whether the sound bite text was taken from an original post or from a response to someone's post (character)

["Original" or "Replies and Comments"]

{Sound bite texts that are taken from a reply/comment provide minimal context as to whose post they are replying to or what the original post said. No missing values}

Paid: Whether the post was sponsored content (character)

["Yes" or "No"]

{We immediately noticed that none of the posts were paid. There are no outliers within this data, as none of the posts were sponsored or paid by anyone. This is a special consideration that our group will keep in mind while studying this data. No missing values}

Media: Whether the post included a link or image (character)

["Link" or "No Media"]

{The majority of entries did not include media, and for those that did have a link it was not included in the data set. No missing values}

Domain: Website that the data was collected from (character)

[[reddit.com](https://www.reddit.com)]

{All posts were taken from [reddit.com](https://www.reddit.com), so this column is consistent for each entry. No missing values.}

Sentiment: Label for the post based on the general tone of its content (character)

[Positives, Negatives, Mixed, or Neutrals]

{Most of the posts had a "neutral" sentiment to them, with very few "positives". The outliers within this data were "negatives" and "mixed". There were only a couple of "negatives" and only one "mixed" sentiment within the data. This data column was also likely an estimate generated by Quid, as the accuracy and dependencies for each label were not specified. No missing values.}

Published Date: Date that the text was posted (datetime)

[7/22/2023, 9/24/2023, 4/22/2024]

{A special consideration is that the dates are formatted using month, day, year. There are no missing values.}

Author Gender: Gender of the user who created the post (character)

[Unknown, Male, Female]

{The outliers within this dataset are "Male" and "Female", meaning that the gender of the authors was very rarely known when collecting this data. This information was collected with Quid, but most reddit users do not include their gender in their profiles. No missing values}

User Name: Anonymous user ID (character)

[user_633000000 or user_685930.854072675]

{AI generated data to mask the real usernames for anonymity. No missing values.}

Richness: Score that indicates how detailed the text is (double)

[1-10]

{The calculation method for this was automated estimates, most likely AI generated. Most notably, the richness score, on average, was around 4— meaning that most of the posts do not contain many details, as a higher richness score indicates higher detail. No missing values.}
